NOBLE

Wealth Technology

Governed technology infrastructure for complex wealth, ownership, risk context and family-office coordination.

Project Brief

NOBLE is a financial-technology architecture for the people, entities and decisions surrounding complex wealth. It connects records, mandates, permissions and jurisdictional context rather than treating balances alone as the operating picture.

Proposed System Architecture

Information & Relationships

The proposed layer connects financial information and the ownership relationships it represents.

Scenario Context

Consistent information and explicit analytical assumptions support scenario assessment.

Authorised Decisions

Authorised people and licensed providers retain their responsibilities, with a record of decisions.

Development Requirements

- Financial-data coverage and interoperability
- Confidentiality and access governance
- Analytical assumptions and applicable regulatory requirements

What Needs to Be Established

- Which information sources and ownership relationships must the initial system represent?
- How are inconsistent records, incomplete data and valuation uncertainty handled?
- Can intended users understand the assumptions and provenance behind a risk analysis?

Customer & Economics

An investment office needs information it can reconcile, question and use within its governance process. Coverage, confidentiality and a clear account of analytical assumptions matter as much as the presentation.

Research & Further Discussion
